

AI ASSISTED CODING

ASSIGNMENT-10.4

M.KEERTHANA

2403A51259

BATCH-11

CSE-GEN

Task 1: Syntax and Error Detection

Task: Identify and fix syntax, indentation, and variable errors in the given script.

```
# buggy_code_task1.py
def add_numbers(a, b)
result = a + b
return reslt
print(add_numbers(10 20))
```

Expected Output:

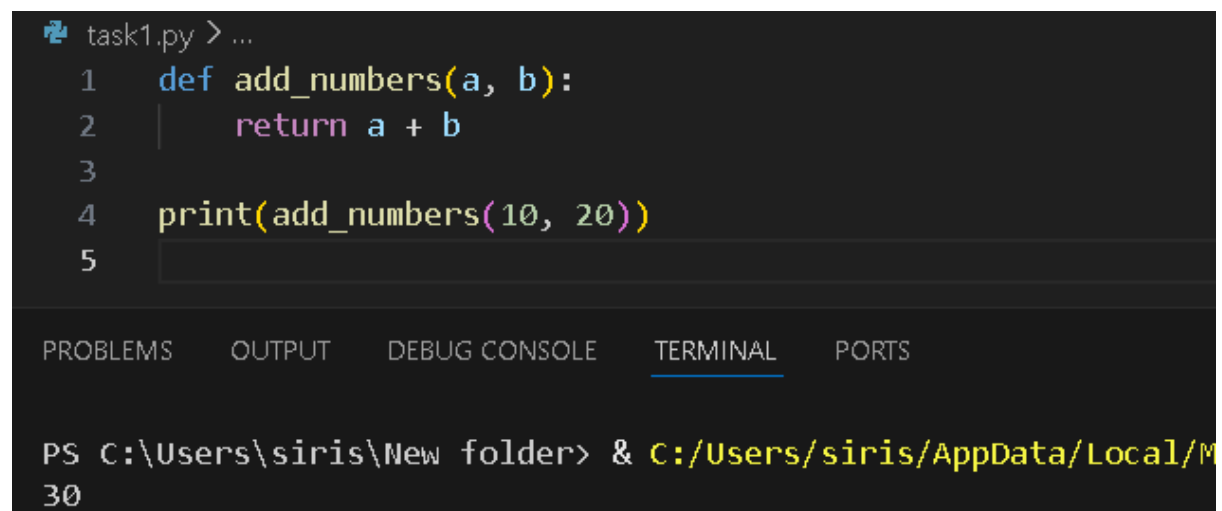

- Corrected code with proper syntax (: after function, fixed variable name, corrected function call).
- AI should explain what was fixed.

PROMPT:

TASK: Fix the syntax errors, indentation, and variable names in the code below.

The corrected function should return the sum of two numbers. Also correct the function call to print the result of adding 10 and 20.

CODE AND THE OUTPUT:

```
task1.py > ...
1  def add_numbers(a, b):
2      return a + b
3
4  print(add_numbers(10, 20))
5

PROBLEMS  OUTPUT  DEBUG CONSOLE  TERMINAL  PORTS

PS C:\Users\siris\New folder> & C:/Users/siris/AppData/Local/M
30
```

Task 2: Logical and Performance Issue Review.

Task: Optimize inefficient logic while keeping the result correct.

```
# buggy_code_task2.py
```

```
def find_duplicates(nums):
```

```
    duplicates = []
```

```
    for i in range(len(nums)):
```

```
        for j in range(len(nums)):
```

```
            if i != j and nums[i] == nums[j] and nums[i] not in duplicates:
```

```
                duplicates.append(nums[i])
```

```
    return duplicates
```

```
numbers = [1,2,3,2,4,5,1,6,1,2]
```

```
print(find_duplicates(numbers))
```

Expected Output:

- More efficient duplicate detection (e.g., using sets).
- AI should explain the optimization.

PROMPT:

TASK: Optimize the find_duplicates function below.

Requirements:

- Return the same duplicates as before
- Use sets or other efficient logic to improve performance to $O(n)$
- Keep output as a list of duplicates.

Buggy code:

```
task1.py > ...
1  def find_duplicates(nums):
2      duplicates = []
3      for i in range(len(nums)):
4          for j in range(len(nums)):
5              if i != j and nums[i] == nums[j] and nums[i] not in duplicates:
6                  duplicates.append(nums[i])
7      return duplicates
8  # Example usage:
```

Corrected code:

```
task1.py > ...
1 def find_duplicates(nums):
2     """Return a list of duplicate elements in nums (optimized with sets)."""
3     seen = set()
4     duplicates = set()
5     for num in nums:
6         if num in seen:
7             duplicates.add(num)
8         else:
9             seen.add(num)
10    return list(duplicates)
11
12 numbers = [1, 2, 3, 2, 4, 5, 1, 6, 1, 2]
13 print(find_duplicates(numbers))
..

```

Task 3: Code Refactoring for Readability

Task: Refactor messy code into clean, PEP 8–compliant, well-structured code.

buggy_code_task3.py

```
def c(n):
x=1
for i in range(1,n+1):
x=x*i
return x
print(c(5))
```

Expected Output:

Function renamed to calculate_factorial.

Proper indentation, variable naming, docstrings, and formatting.

AI should provide a more readable version

prompt:

TASK: Refactor the factorial function below for readability:

- Rename function to calculate_factorial
- Follow PEP 8 formatting and indentation
- Use descriptive variable names
- Add a Google-style docstring and type hints
- Include error handling for negative input.

Messy code:

```
task3.py > ...
1 def c(n):
2     x=1
3     for i in range(1,n+1):
4         x=x*i
5     return x
6     print(c(5))
7
```

Corrected code:

```
task3.py > ...
1 def calculate_factorial(n: int) -> int:
2     """Calculate the factorial of a non-negative integer.
3
4     Args:
5         n (int): The number to calculate the factorial for.
6
7     Returns:
8         int: The factorial of n.
9
10    Raises:
11        ValueError: If n is negative.
12    """
13    if n < 0:
14        raise ValueError("Input must be a non-negative integer.")
15    result = 1
16    for i in range(1, n + 1):
17        result *= i
18    return result
19
20 print(calculate_factorial(5))
```

Task 4: Security and Error Handling Enhancement

Task: Add security practices and exception handling to the code.

buggy_code_task4.py

```
import sqlite3
```

```
def get_user_data(user_id):
```

```
    conn = sqlite3.connect("users.db")
```

```
    cursor = conn.cursor()
```

```
    query = f"SELECT * FROM users WHERE id = {user_id};" #
```

Potential SQL injection risk

```
    cursor.execute(query)
```

```
    result = cursor.fetchall()
```

```
    conn.close()
```

```
    return result
```

```
    user_input = input("Enter user ID: ")
```

```
    print(get_user_data(user_input))
```

Expected Output:

Safe query using parameterized SQL (? placeholders).

Try-except block for database errors.
Input validation before query execution.

Prompt:

TASK: Enhance security and error handling in the function below:

- Use parameterized SQL instead of f-strings to prevent injection
- Add try/except/finally for database connection and errors
- Validate that user input is an integer before executing the query
- Use clear function and variable names, plus docstrings.

Messy code:

```
task4.py > ...
1  import sqlite3
2
3  def get_user_data(user_id):
4      conn = sqlite3.connect("users.db")
5      cursor = conn.cursor()
6      query = f"SELECT * FROM users WHERE id = {user_id};" # Potential SQL injection risk
7      cursor.execute(query)
8      result = cursor.fetchall()
9      conn.close()
10     return result
11
12     user_input = input("Enter user ID: ")
13     print(get_user_data(user_input))
14
```

Problems with messy code:

- **SQL injection risk** — f-string directly inserting user_id.
- **No input validation** — user_id might not be an integer.
- **No exception handling** — DB errors could crash the program.

Updated code:

```
task4.py > get_user_data_by_id
1  import sqlite3
2  def get_user_data_by_id(user_id: int):
3      """Retrieve user data from the database by user ID.
4
5      Args:
6          user_id (int): The ID of the user to retrieve.
7
8      Returns:
9          list: List of tuples containing user data, or an empty list if not found or error occurs.
10     """
11     conn = None
12     try:
13         conn = sqlite3.connect("users.db")
14         cursor = conn.cursor()
15         query = "SELECT * FROM users WHERE id = ?;"
16         cursor.execute(query, (user_id,))
17         result = cursor.fetchall()
18         return result
19     except sqlite3.Error as e:
20         print(f"Database error: {e}")
21         return []
22     finally:
23         if conn:
24             conn.close()
25
26 def get_valid_user_id():
27     """Prompt the user for a valid integer user ID."""
28     user_input = input("Enter user ID: ")
29     if not user_input.isdigit():
30         print("Invalid input. Please enter a valid integer user ID.")
31         return None
32     return int(user_input)
33
34 user_id = get_valid_user_id()
35 if user_id is not None:
36     print(get_user_data_by_id(user_id))
37
```

Task 5: Automated Code Review Report Generation

Task: Generate a review report for this messy code.

```
# buggy_code_task5.py
```

```
def calc(x,y,z):
if z=="add":
return x+y
elif z=="sub": return x-y
elif z=="mul":
return x*y
elif z=="div":
return x/y
else: print("wrong")
print(calc(10,5,"add"))
print(calc(10,0,"div"))
```

Expected Output:

AI-generated review report should mention:

- o Missing docstrings
- o Inconsistent formatting (indentation, inline return)
- o Missing error handling for division by zero
- o Non-descriptive function/variable names
- o Suggestions for readability and PEP 8 compliance

prompt:

TASK: Perform an automated code review of the following function.

- Identify missing docstrings
- Identify inconsistent formatting and indentation
- Identify missing error handling (like division by zero)
- Identify non-descriptive names
- Suggest improvements for readability and PEP 8 compliance.

Messy code:

```
task5.py > ...
1  def calc(x,y,z):
2  if z=="add":
3  return x+y
4  elif z=="sub": return x-y
5  elif z=="mul":
6  return x*y
7  elif z=="div":
8  return x/y
9  else: print("wrong")
10 print(calc(10,5,"add"))
11 print(calc(10,0,"div"))
12
```

Updated code:

```
task5.py > ...
1  def calculate(a, b, operation):
2      """Perform a basic arithmetic operation on two numbers.
3
4      Args:
5          a (float): The first operand.
6          b (float): The second operand.
7          operation (str): The operation to perform: 'add', 'sub', 'mul', or 'div'.
8
9      Returns:
10         float: The result of the operation.
11         str: An error message if the operation is invalid or causes an error.
12     """
13     if operation == "add":
14         return a + b
15     elif operation == "sub":
16         return a - b
17     elif operation == "mul":
18         return a * b
19     elif operation == "div":
20         if b == 0:
21             return "Error: Division by zero."
22         return a / b
23     else:
24         return "Error: Invalid operation."
25
26 print(calculate(10, 5, "add"))
27 print(calculate(10, 0, "div"))
28
```

Report:

1. Missing Docstrings

- The function `calc` lacks a docstring explaining its purpose, parameters, and return value.

2. Inconsistent Formatting and Indentation

- The function body is not properly indented.
- The `elif` and `else` statements are not consistently formatted.
- The `print` statements are not separated from the function definition.

3. Missing Error Handling

- Division by zero is not handled, which will raise a `ZeroDivisionError` if `y` is zero and `z` is "div".

4. Non-descriptive Names

- The function name `calc` and parameter names `x`, `y`, and `z` are not descriptive. More meaningful names like `a`, `b`, and `operation` would improve readability.

5. Other Suggestions

- Use `return` instead of `print` for error messages to keep function output consistent.
- Consider using a dictionary to map operations to functions for scalability.
- Follow PEP 8: add spaces after commas, use lowercase with underscores for function names, and add two blank lines before function definitions.

Suggested Improvements

- Add a docstring.
- Use descriptive parameter names.
- Properly indent the function.
- Add error handling for division by zero.
- Use PEP 8 formatting.
- Return error messages instead of printing them inside the function.
